

Predicting the 2024 UEFA Euro Using Poisson Distribution

Football predictions have always been a fascinating topic for data scientists and enthusiasts alike. In this project, we leverage the power of the Poisson distribution to forecast the outcomes of the 2024 UEFA European Championship. This method is particularly well-suited for predicting football scores due to the nature of the game, where goals are relatively rare events.

```
In [1]: #installing the necessary libraries
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
from scipy.stats import poisson
from sklearn.metrics import accuracy_score
from sklearn.metrics import roc_curve, roc_auc_score
import matplotlib.colors as mcolors
import warnings
pd.set_option('display.max_rows', 10000)
pd.set_option('display.max_columns', 500)
warnings.filterwarnings('ignore')
```

Data Collection

The first step in our analysis involved gathering historical match data. The dataset sourced from Kaggle contains the results of international football matches starting from the very first official match in 1872 up to 2024.

```
In [2]: #Reading the
df = pd.read_csv('results.csv', sep=',',)
#Dropping matches without final result
df=df[~df['home_score'].isna()]
```

```
In [3]: df
```

Out[3]:

ELO Ranking System

The Elo ranking system is a method for calculating the relative skill levels of teams. It is useful for ranking teams based on their performance in previous matches. The Elo rating is dynamic, meaning it changes based on the results of matches, rewarding teams for wins and penalizing them for losses, while also considering the strength of the opponents.

To create our dataset, we need to define some parameters, such as the importance of each tournament in the points exchanged by the Elo ranking system.

```
In [4]: #Auxiliary funtions for update the ratings
confederation_tournaments=['AFC Asian Cup','African Cup of Nations','UEFA Euro','Co
confederation_clasification=['UEFA Euro qualification','African Cup of Nations qual
def k_value(tournament):
    k=5
    if tournament == 'Friendly':
        k=10
    elif tournament in confederation_clasification:
        k=20
    elif tournament == 'FIFA World Cup qualification':
        k=25
    elif tournament in confederation_tournaments:
        k=40
    elif tournament == 'FIFA World Cup':
```

```

        k=50
    return k

def expected_result(loc,aw):
    dr=loc-aw
    we=(1/(10**(-dr/400)+1))
    return [np.round(we,3),1-np.round(we,3)]

def actual_result(loc,aw):
    if loc<aw:
        wa=1
        wl=0
    elif loc>aw:
        wa=0
        wl=1
    elif loc==aw:
        wa=0.5
        wl=0.5
    return [wl,wa]

def calculate_elo(elo_l,elo_v,local_goals,away_goals,tournament):

    k=k_value(tournament)
    wl,wv=actual_result(local_goals,away_goals)
    wel,wev=expected_result(elo_l,elo_v)

    elo_ln=elo_l+k*(wl-wel)
    elo_vn=elo_v+k*(wv-wev)

    return elo_ln,elo_vn,wel,wev

```

```

In [5]: #Calculating the elo points for all historical internatinal matches
current_elo={}
for idx,row in df.iterrows():

    local=row['home_team']
    away=row['away_team']
    local_goals=row['home_score']
    away_goals=row['away_score']
    tournament = row['tournament']

    if local not in current_elo.keys():

        bars = plt.barh(top_teams['Team'], top_teams['Elo'], color=colors)

        # Add text annotations
        for bar in bars:
            plt.text(
                bar.get_width() + 5,
                bar.get_y() + bar.get_height() / 2,
                f'{bar.get_width():.0f}',
                ha='left',
                va='center',
                fontsize=10
            )

        # Highlighting the top team
        bars[0].set_edgecolor('black')
        bars[0].set_linewidth(2)

        # Customizing the plot
        plt.xlabel('Elo Rating')
        plt.title('Top Teams by Elo Rating')
        plt.gca().invert_yaxis() # Invert y-axis to display the highest Elo at the top
        plt.grid(axis='x', linestyle='--', alpha=0.7)

        # Show plot
        plt.tight_layout()
        plt.show()

        # Call the function
        plot_top_elo(elos, 10)
```

We will focus only on the teams participating in the 2024 Euro. Therefore, the ranking would be as follows:

```
In [8]: eurocup_teams =[
    "Albania", "Scotland", "Hungary", "Romania",
    "Germany", "Slovakia", "England", "Czech Republic",
    "Austria", "Slovenia", "Italy", "Serbia",
    "Belgium", "Spain", "Netherlands", "Switzerland",
    "Croatia", "France", "Poland", "Turkey",
    "Denmark", "Georgia", "Portugal", "Ukraine"
]

elos_ranking_euro = elos[elos.Team.isin(eurocup_teams)].copy()
plot_top_elo(elos_ranking_euro, 24)
```

Based on this ranking, we can say that France is the favorite to win the Euro, while Albania is the weakest team in the tournament.

One of the problems with international matches is that we don't have the statistics of a league, making it difficult to determine which team has a better attack because it depends on the quality of the opponent. To solve this, and using the same idea as the Elo ranking system above, we can create a ranking for attacking power and defensive power.

```
In [9]: elos_ranking_euro
```

212	2024-06-26	Georgia	1.177952	0.987056	88	213
272	2024-06-24	Albania	0.958692	0.926319	80	273

Based on this ranking, we can conclude that the teams with the best attack are Germany and Spain. The teams with the best defense are England, Spain, and Italy.

Goals Expected and Poisson Distribution

The best aspect of this ranking is that we can use it to calculate the expected goals in a match. The expected goals for a team can be calculated as:

$$T_c E_n s P_n m$$

Additionally, in non-neutral matches, we have to set a parameter for the advantage of the home team. This parameter adjusts the expected goals to account for the home field advantage.

Let see if the results adjust with Expected goals we predicted, for doing that we consider the results of European tournaments of the last 14 years.

We can see that the expected goals we created adjust very well to the real number of goals in the matches. So we can use the poisson distribution to predict the results of the matches

The Poisson distribution is defined by the probability mass function:

$$P(X=k) = \frac{\lambda^k e^{-\lambda}}{k!}$$

where:

$P(X=k)$ is the probability of k goals being scored, λ is the average number of goals scored in a match.

In our context, λ represents the average number of goals a team is expected to score.

```
In [30]: data = df2['total_score']

# Calculate the mean of the data as it will be the lambda (rate parameter) for the
mu = data.mean()

# Create a range of numbers from 0 to the maximum number of goals in a match (this
k = np.arange(0, data.max()+1)

# Create a Poisson distribution with the mean obtained
poisson_pmf = poisson.pmf(k, mu)

plt.figure(figsize=(12,8))

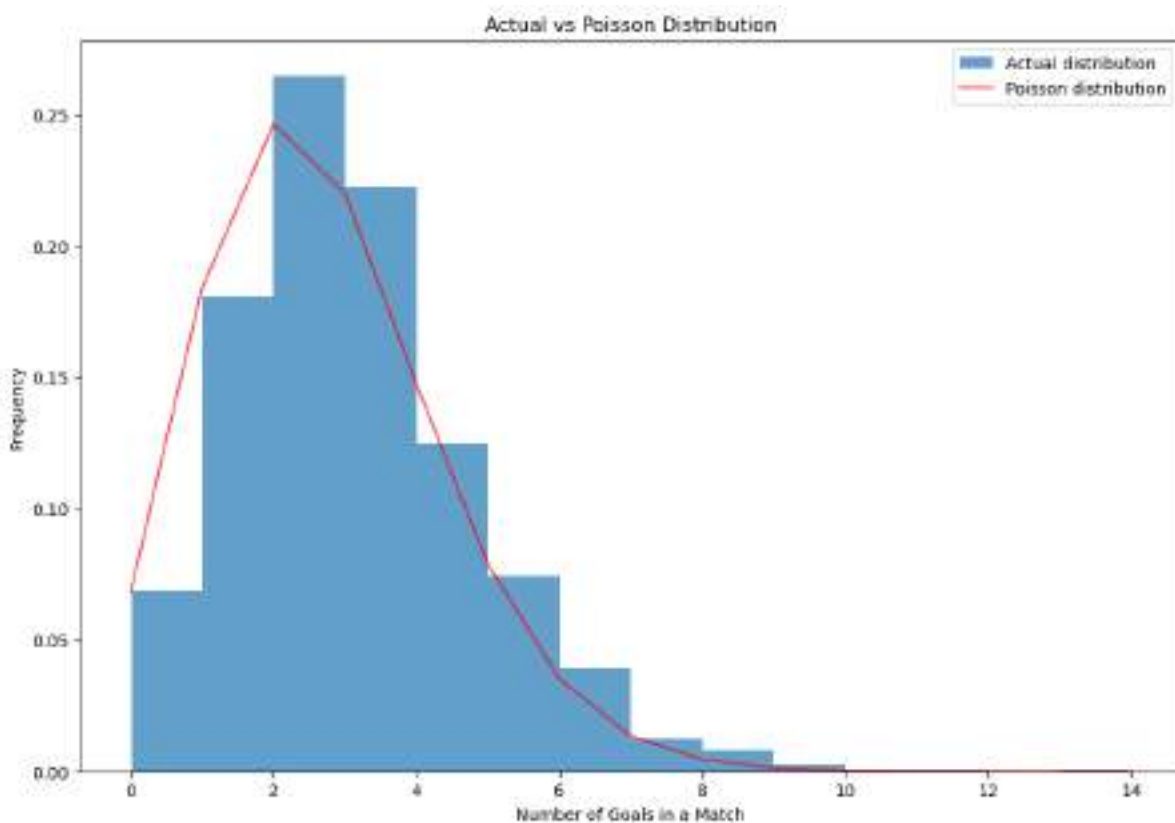

# Plot the actual distribution of goals
plt.hist(data, bins=k, density=True, alpha=0.7, label='Actual distribution')

# Plot the Poisson distribution
plt.plot(k, poisson_pmf, 'r-', alpha=0.7, label='Poisson distribution')

plt.title('Actual vs Poisson Distribution')
```

```
plt.xlabel('Number of Goals in a Match')
plt.ylabel('Frequency')
plt.legend()

plt.show()
```

With the utilization of the given distribution, we can use the probabilities to predict the matches.

```

It can be said the same for the away probabilities, so we can conclude that this predictions are relative good for the matches in Euro.

2024 Euro Prediction

Once we have the probabilities, we can finally use it to predict the results of the 2024 Euro. Let see it.

By running numerous simulations, we can estimate the probabilities of different outcomes for each match. We simulate each match multiple times to predict the likely outcomes and the points each team might accumulate. The table presented below illustrates the predicted probabilities for each team to conclude the group stage in a particular position.

```
In [ ]: group_matches[group_matches['Result']=='Draw']
```

```
In [ ]: group_matches.columns
```

```

In []: "Niclas Füllkrug"

As we can see, the teams that are more likely to win its respective group are Portugal, Belgium and England. And the team which have more difficult to pass the round is Albania.

Conclusion

Predicting football match outcomes is inherently uncertain, but statistical models like the Poisson distribution offer a structured approach to quantify this uncertainty. Our predictions for the 2024 UEFA Euro provide a glimpse into possible outcomes based on historical performance data. As with all models, the key is to continually refine our approach as new data becomes available.
